# Making a Pull Request

**Author:**

Guillermo Bueno Vargas

# Contents

# 1   Forking the repository

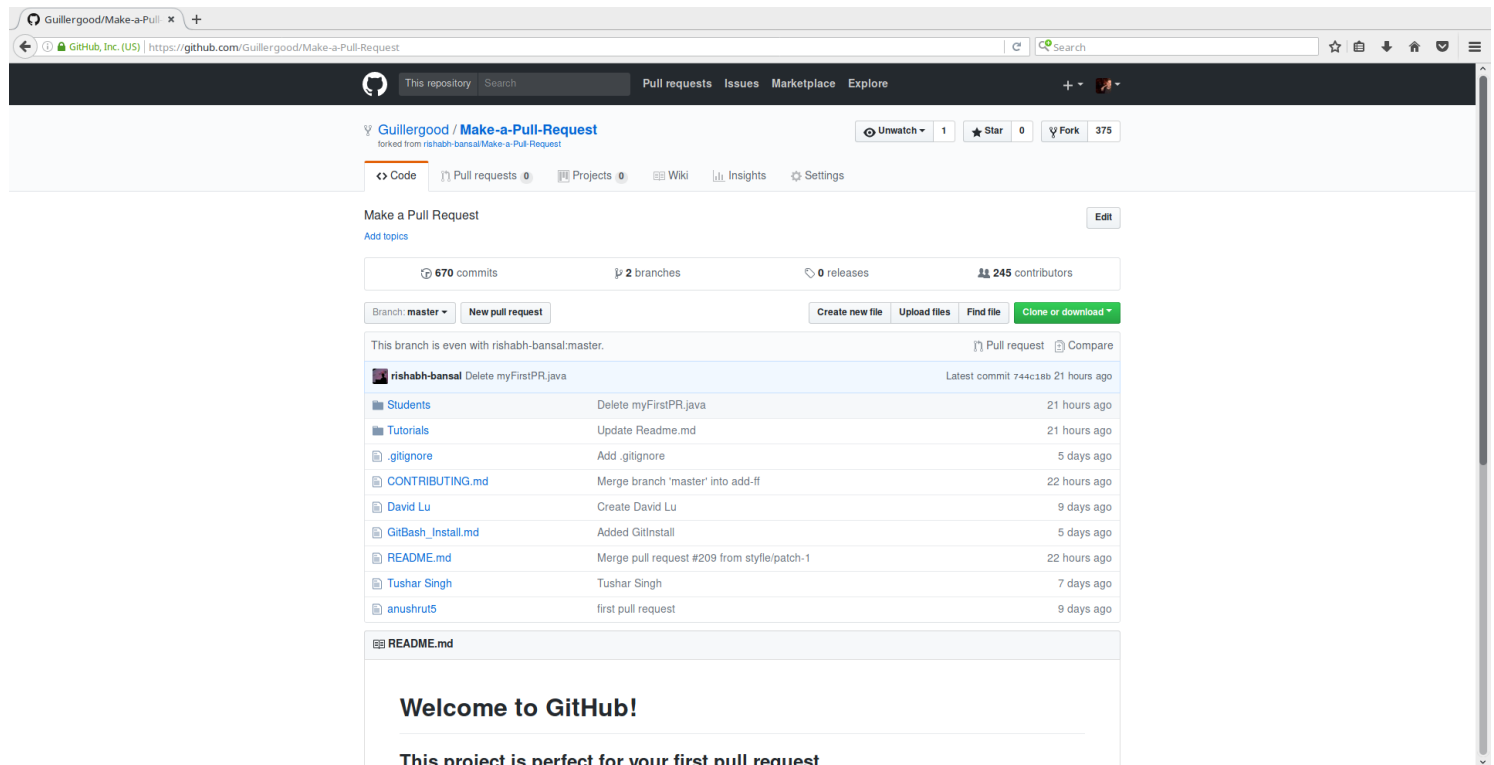

In order to make your pull request, it is recommended to fork the repository where you are going to work. To do so, you need to press "Fork" button located under your logo(right upper corner).

# 2    Cloning repository

When you have it cloned, you will have a copy the same repository in your account and ready to work with. Copy the direction of the remote repository to clone it in your PC.

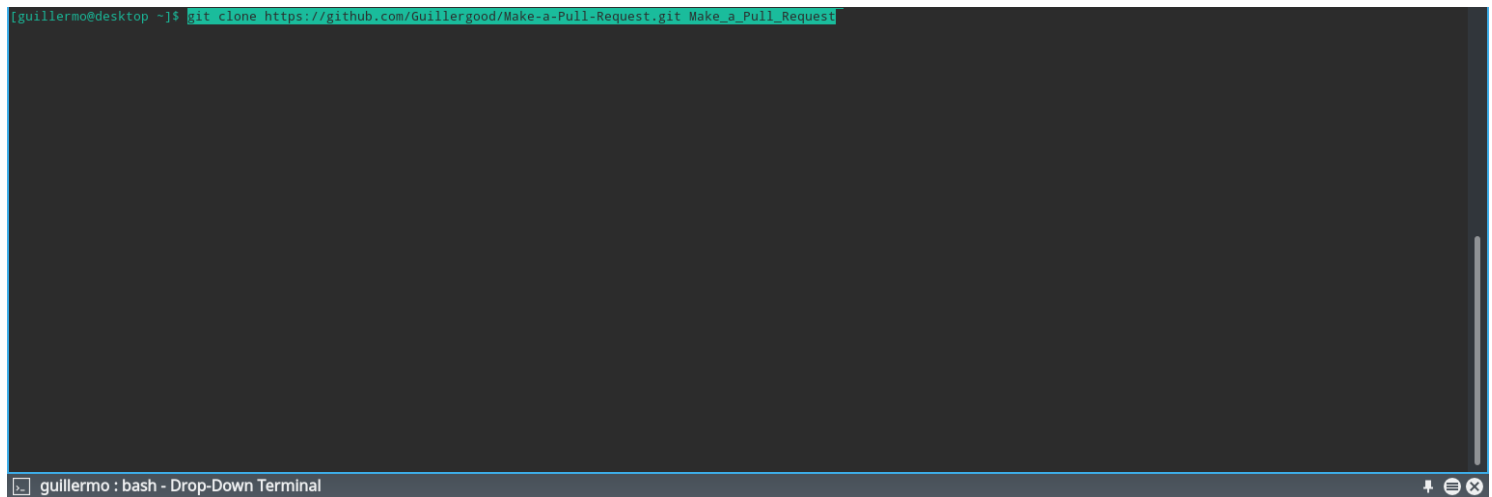

And then,just **git clone "the-link" "your-local-directory"**. I assume that you have git installed! When you have finished working, have added the files, have committed all the changes and also have pushed them. It is time to make a pull request

# 3    Making a pull request

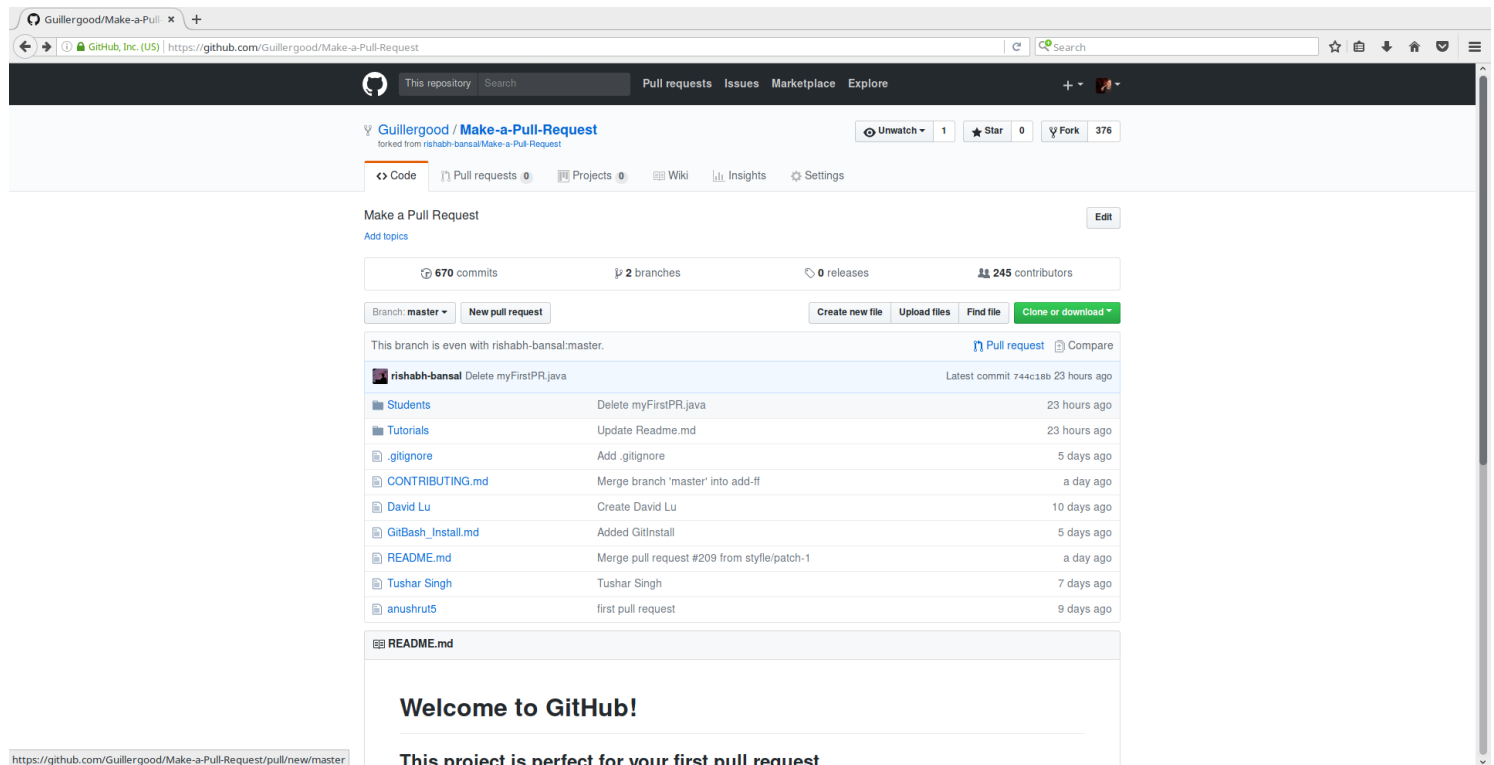

In your own copy of repository, you will have to press pull request under the button "Clone or download". And that's it! Don't forget to explain all the changes and issues corrected.
